# Easy ETL with Biml™

Andrzej Kukula – [andrzej.kukula@gmail.com](mailto:andrzej.kukula@gmail.com)

Marcin Szeliga – [marcin@sqlexpert.pl](mailto:marcin@sqlexpert.pl)

# Agenda

- What's ETL
- SSIS – pros and cons
- Example case
- Traditional approach
- Novel approach
- Biml and BimlScript
- Benefits

# ETL

- Extract, Transform, Load
  - Data extraction from an OLTP system, denormalization, conversion, modelling and loading into Data Warehouse, Operational Data Store, Data Mart
  - Also ELT, ETLT
  - Performance reasons
  - Historic data handling (SCD)
  - Better analysis capabilities

Image from: <https://namitkabra.wordpress.com/2014/09/16/need-for-etl-tool-as-explained-to-undergraduate-students-part-2/>

# SQL Server Integration Services

- Well known technology for ETL, integration, interfacing, data movement automation
- First choice for staging/data loading process
- Ability to perform sophisticated data manipulation
- Runtime and Integrated Services Catalog
- Integrated with SQL Server
- Lots of components
- Very good performance

# Problems with SSIS

- Package design process in SSDT-BI
  - Manual
  - Not generic
  - Not developer-friendly
    - Doesn't allow code reuse – repeatable work of implementing many similar packages
    - No support for version control
  - Frustrating, slow, boring, painful, error-prone, expensive
- At low level
  - DTSX is almost unreadable and unmodifiable

# Problems with SSIS

- Metadata management is difficult
  - substantial development time is spent on solving dreaded metadata issues

- is this something we should really focus on?...

# More problems with SSIS

- Automatic generation of packages is difficult
  - DTS API is not trivial
  - EzAPI ditto, also not updated
  - Generation of target DTSX' XML manually is close to impossible in reasonable time
  - Manually generated packages won't run or won't open in SSDT most of the time (the infamous message „Package Load error 0xC0010014 in CPackage::LoadFromXML”)

# Executive Problems with SSIS

- ETL process is
  - Slow
  - Expensive
  - Difficult to implement
  - Difficult to maintain
  - Difficult to adapt to changes
    - One new column introduced in one source table can take **weeks** or even **months** to implement

65             name="OleDbConnection
66             refId="Package\Copy to Stage\Person.Connect
67           </connections>
68         <outputs>
69           <output
70             name="Output"
71             refId="Package\Copy to Stage\Person.Outputs

1  <?xml version="1.0" encoding="utf-8"
2  <DTS:Executable
3    DTS:CreationDate="04/26/2015 20:46
4    DTS:CreationName="Microsoft.Packag
5    DTS:CreatorComputerName="AK81"
6    DTS:CreatorName="Andrzej"
7    DTS:DTSID="{4510E215-AEBB-4A6B-89C
8    DTS:ExecutableType="Microsoft.Pack
9    DTS:LastModifiedProductVersion=""
10   DTS:LocaleID="1045"

693       endId="Package\Copy to
694       name="Add LoadDateTime
695       refId="Package\Copy to
696       startId="Package\Copy
697     </paths>
698   </pipeline>
699 </DTS:ObjectData>
700 </DTS:Executable>
701 </DTS:Executables>
702 <DTS:Property
703   DTS:Name="PackageFormatVersion">
704 </DTS:Executable>
```

Is this reasonable  
amount of code to  
accomplish the task?...

# What if...?

- ...we changed rules of the game, and instead of creating SSIS packages by hand, just give a computer **recipes** on how to make the packages for us?
  - Recipe language easy to learn and use
    - With smart default values and default behavior
  - Be able to use programming language to make recipes more dynamic, easier adapting to changes in databases and business requirements
  - **Don't bother with metadata** (most of the time)

# What if...?

- Have full power of .NET framework available
- Organize recipes into templates and libraries for multiple use
- Build SSIS packages automatically
  - in repeatable way
- Use version control to track code changes
- Use CI and CD to automate deployments

# Enter Biml™

```
1 <Package Name="Load Person" ProtectionLevel="EncryptSensitiveWithUserKey">
2   <Tasks>
3     <Dataflow Name="Copy to Stage">
4       <Transformations>
5         <OleDbSource Name="Person" ConnectionName="Source">
6           <TableInput TableName="AdventureWorks2012.Person.Person" />
7         </OleDbSource>
8         <DerivedColumns Name="Add LoadDateTime">
9           <Columns>
10            <Column Name="LoadDateTime" DataType="DateTime2" Scale="7">
11              @[System::ContainerStartTime]</Column>
12            </Columns>
13          </DerivedColumns>
14          <OleDbDestination Name="StgPerson" ConnectionName="Stage">
15            <TableOutput TableName="Stage.AW.Person" />
16          </OleDbDestination>
17        </Transformations>
18      </Dataflow>
19    </Tasks>
20  </Package>
```

Is this reasonable  
amount of code to  
accomplish the task?

# What's Biml?

- Business Intelligence Markup Language
- A really easy XML-based language to describe BI assets
  - Connections
  - Tables, Views
  - SSIS Packages, SSIS Projects
  - Dimensions, Measure Groups, Cubes
  - and more...
- Available straight in SSDT-BI for free!
  - All you need to begin is BIDS Helper add-in
  - With Biml Intellisense

**Demo!**

# But wait, there's more!

## BimlScript

- The ability to instrument Biml with C#/VB.NET code
- Full power of .NET framework and all available libraries at your disposal

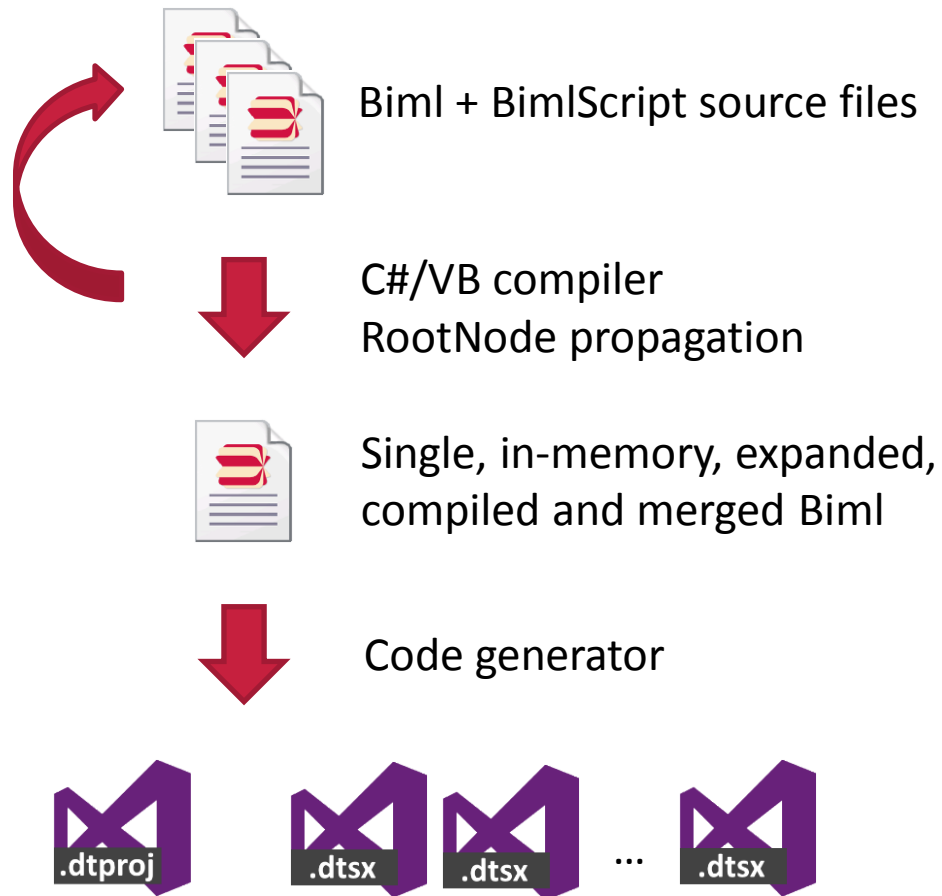

```
<Packages>
  <# foreach (var table in listOfTables) { #>
    <Package Name="Load <#= table.Name #>" ... />
  <# } #>
</Packages>
```

- Supports including and calling other Biml files, and referencing external .NET assemblies
- Allows even extending built-in Biml .NET classes
- Available in SSDT with BIDS Helper

# How does it work?

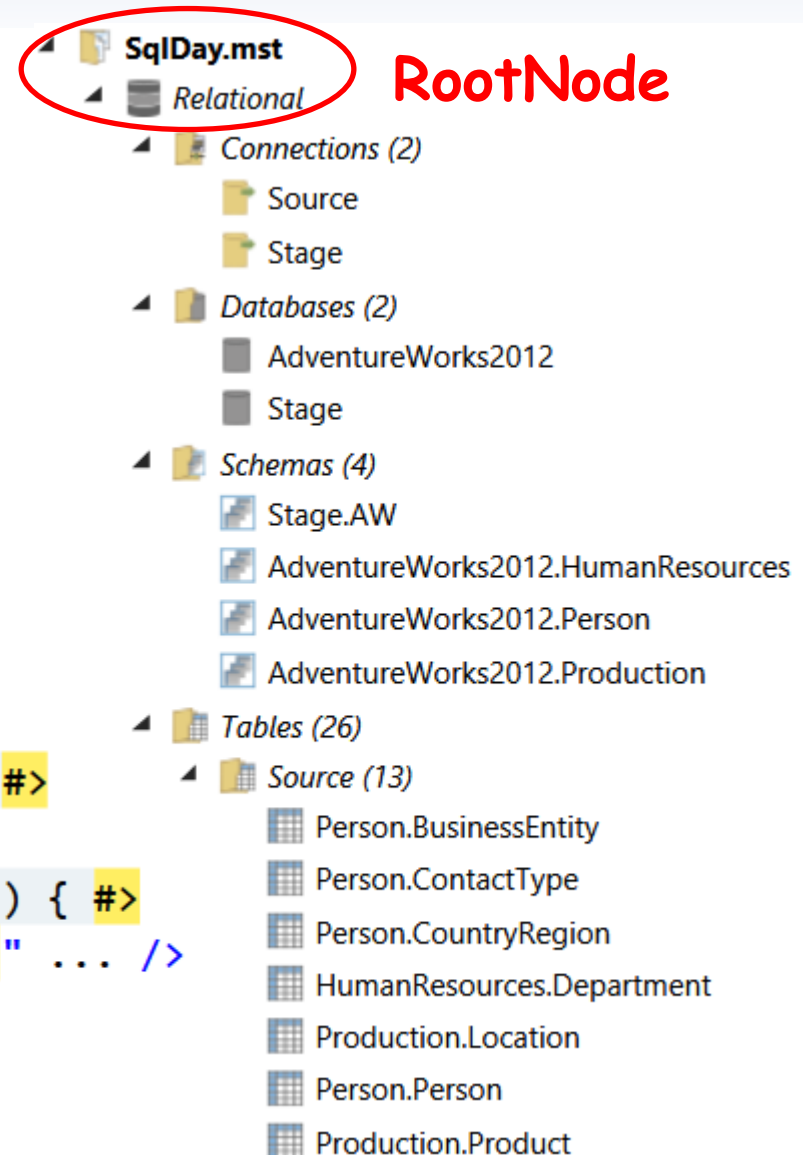

# RootNode

- The **model** of all assets in the project
- Used within C#/VB code
- Read/write

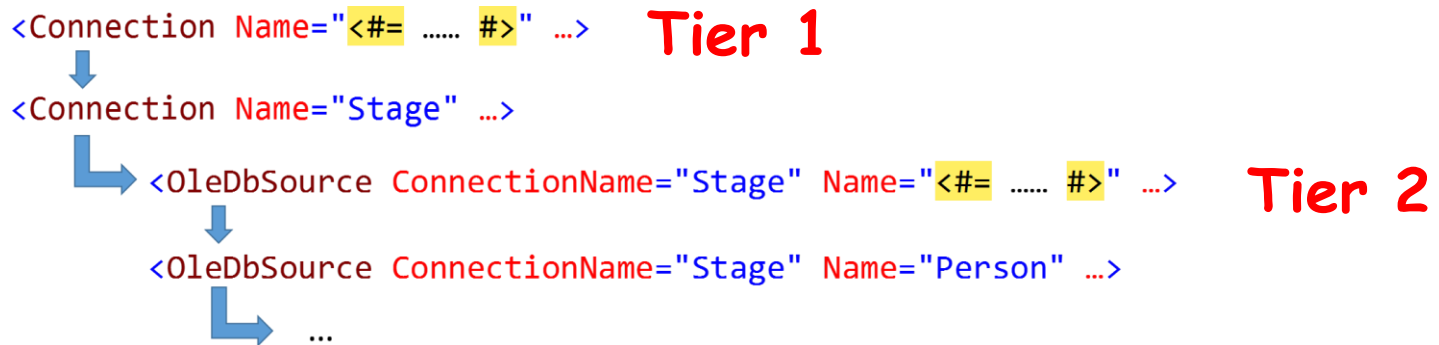

```
<# var listOfTables = RootNode.Tables
    .Where(t => t.Database.Name
        == "AdventureWorks2012"); #>

<Packages>
    <# foreach (var table in listOfTables) { #>
        <Package Name="Load <#= table.Name #>" ... />
    <# } #>
</Packages>
```

# BimlScript Features

- „Layered” expansion based on „tiers”

- Makes it easy to prepare resources before using them (e.g. fetch from metadata store)
- Tier  $n+1$  sees everything in tier  $n$  in already expanded form
- No limit on number of tiers

# BimlScript Features

- Just to name a few
  - Ability to dynamically fetch database schema during generation of packages
  - Ease of implementation of custom metadata-based processing logic
  - Automatic data type conversions during Data Flow Task
  - SCD handling during loading of dimensions
  - SQL Server's built-in extended properties proven to be good metadata storage
- Can be easily adapted to new/changed requirements
- Spectacular effects need just a few lines of C# code

# Mist IDE for Biml

- Dedicated development environment just for Biml
- Compatible with SQL Server/SSIS/SSAS 2008-2014
- Makes it super easy to work with large, advanced BimlScript projects
  - Full Biml/C#/VB Intellisense
  - Live preview of expanded BimlScript
  - Graphical designers
- It can even completely replace SSDT-BI for SSIS development!
  - Integration Services is just a runtime
- The fastest ETL development
- Our further demos will use Mist

**Demo!**

# More features

- Transformers and „Frameworks”
  - Ability to change the way how code is generated
- DDL generation
- MSBuild integration
  - CI with TFS Build, TeamCity immediately possible

# How to benefit it?

- BI Project Decision Makers
  - Faster initial delivery
  - Lower cost of change
  - Immediate Biml/Mist ROI
- BI Architects
  - Reusable Design Patterns with Biml/BimlScript
  - One project compatible with SQL Server 2005-2014
  - Easily manage large BI code base, tasks, and issues using TFS
  - Plan for BI Continuous Integration/Continuous Delivery

# How to benefit it?

- ETL developers
  - Fast Biml learning curve
  - Generate your DTSX faster with Biml instead of drag'n'drop
  - Embrace DRY in BI development
  - Use proper version control to manage your sources
- BI consultants
  - Increased productivity
  - Build your Biml/BimlScript code library and reuse it in different projects
  - No runtime license costs for customers

**Eric Heilman**

@EricHeilman

+ Obserwuj

Only with [#biml](#) can you add 5 lines of code to a single file, press a button and spit out 55 new [#SSIS](#) packages. I am a total nerd [#fb](#)
